Andrews had published three papers by the time he had completed his thesis work: An asymptotic expression for the number of solutions of a general class of Diophantine equations (1961); A lower bound for the volume of strictly convex bodies with many boundary lattice points (1963); and On estimates in number theory (1963).

author of the well-established text *Number Theory* (first published by Saunders in 1971 and reprinted by Dover in 1994), has led an active career discovering fascinating phenomena in his chosen field — number theory. Perhaps his greatest discovery, however, was not solely one in the intellectual realm but in the physical world as well.

$22 + q > (h_1) + k \equiv 221 + k \equiv 0 \pmod{p}$, and, in view of $21 + CP(h_1) > 2'$ we get Thus, the number $221 + q > (h_1) + k$ is composite and $> a$ since $p = 211 + k \sim 22m + \dots + k > a$, which completes the proof. This proof fails for $k = 1$ since we do not know if there exist infinitely many composite Fermat numbers.

Dr. Andrews gives an example in . and in . If you've seen different number bases before this should be rather trivial; however, sometimes it's worth refreshing up on. The idea behind this is to really formalize representing unique numbers in different bases. Dr. Andrews officially states the theorem as such. Theorem 1-3 (Basis Representation Theorem)
